

Newton's Laws

First: Momentum stays the same as long as $\vec{F}_{net} = 0$.

Second: $\vec{F}_{net} = m\vec{a}$.

Third: Every force occurs as one member of an action/reaction pair of forces.

Conservation

Momentum, energy, angular momentum, charge are conserved for an isolated system. Mass is conserved in normal situations.

Linear Motion

$$d = v_i t + \frac{1}{2} a t^2 \quad v_f = v_i + a t \quad v_f^2 = v_i^2 + 2 a d \quad v_f^2 = v_i^2 + 2 a d$$

$$K = \frac{1}{2} m v^2 \quad \vec{p} = m \vec{v}$$

$$\Delta K = J_x = \int_{t_i}^{t_f} F_x(t) dt \quad \Delta p_s = W = \int_{s_i}^{s_f} F_s ds$$

Springs

$$\text{Hooke's law: } (F_{sp})_s = -k \Delta s \quad U_s = \frac{1}{2} k (\Delta s)^2$$

Rotational Motion

$$\omega_f = \omega_i + \alpha \Delta t \quad \theta_f = \theta_i + \omega_i \Delta t + \frac{1}{2} \alpha (\Delta t)^2 \quad \omega_f^2 = \omega_i^2 + 2 \alpha \Delta \theta$$

$$a_{\text{tangential}} = \alpha r \quad a_{\text{centripital}} = v^2 / r = \omega^2 r \quad x_{cm} = \frac{1}{M} \int x dm$$

$$I = \sum_i m_i r_i^2 \quad I = \int r^2 dm$$

$$K_{rot} = \frac{1}{2} I \omega^2 \quad E_{mech} = K_{rot} + U_g = \frac{1}{2} I \omega^2 + M g y_{cm}$$

$$\text{parallel axis theorem: } I = I_{cm} + M d^2 \quad \tau \equiv r F \sin \phi \quad \alpha = \frac{\tau_{net}}{I}$$

$$v_{cm} = R \omega \quad K_{\text{rolling}} = K_{rot} + K_{cm} \quad \vec{\tau} = \vec{r} \times \vec{F} \quad \vec{L} = \vec{r} \times \vec{p}$$

$$d\vec{L}/dt = \vec{\tau}_{net} \quad \vec{L} = I \vec{\omega}$$

Planets

$$F_{1on2} = F_{2on1} = \frac{G m_1 m_2}{r^2} \quad \text{Satellite Speed: } v = \sqrt{\frac{GM}{r}}$$

$$\text{Escape Velocity: } v = \sqrt{\frac{2GM}{r}} \quad \text{On Surface: } g = \frac{GM}{R^2}$$

$$U_g = \frac{G m_1 m_2}{r} \quad \text{Kepler's 3rd: } T^2 = \left(\frac{4\pi^2}{GM}\right) r^3$$

$$\text{Kepler's 2nd: } \frac{\Delta A}{\Delta t} = \frac{L}{2m}$$

Simple Harmonic/Circular Motion

Uniform circular motion projected onto one dimension is simple harmonic motion.

Any system with a linear restoring force will undergo simple harmonic motion around the equilibrium position.

$$x(t) = A \cos(\omega t + \phi_0) \quad v_x(t) = -\omega A \sin(\omega t + \phi_0)$$

$$\text{pendulum: } \omega = 2\pi f = \sqrt{\frac{g}{L}} \quad \text{damped oscillator: } x(t) = A e^{-bt/2m} \cos(\omega t + \phi_0)$$

$$\text{time constant: } \tau = m/b \quad \text{damped system: } E = E_0 e^{-t/\tau}$$

Fluids and Elasticity

Archimedes' principle: The magnitude of the buoyant force equals the weight of the fluid displaced by the object.

Ideal-fluid model: Incompressible. Smooth, laminar flow. Non-viscous.

Bernoulli's is a statement of energy conservation.

$$p = F/A \quad p_g = p - 1 \quad \rho = m/V$$

$$v_1 A_1 = v_2 A_2 \quad \text{Bernoulli's: } p_1 + \frac{1}{2} \rho g y_1 = p_2 + \frac{1}{2} \rho v_2^2 + \rho g y_2$$

$$(F/A) = Y(\Delta L/L) \quad p = -B(\Delta V/V)$$

Matter

Phases: solid, liquid gas. Ideal-gas model. Isochoric process $\rightarrow V$ constant and $W=0$, Isobaric $\rightarrow p=\text{constant}$, Isothermal $\rightarrow T$ constant and $\Delta E_{th} = 0$, Adiabatic $\rightarrow Q=0$. conduction, convection, radiation, evaporation.

Second law: entropy cannot decrease.

$$\text{Ideal Gas Law: } pV = nRT$$

$$\text{First Law of Thermo: } \Delta E_{th} = W + Q \quad W = - \int_{V_i}^{V_f} p dV$$

$$\text{specific heat: } Q = Mc\Delta T \quad \epsilon_{\text{avg}} = \frac{3}{2} k_B T \quad p = \frac{2}{3} \frac{N}{V} \epsilon_{\text{avg}}$$

Waves

Transverse, Longitudinal. Snapshot graph, history graph. Superposition, nodes, and antinodes.

$$v = \lambda f \quad \omega = vk \quad D(x, t) = A \sin(kx - \omega t + \phi_0) \quad I = P/a \quad I \propto A^2$$

$$\text{Doppler: } f_{\pm} = \frac{f_0}{1 \mp v_s/v} \quad \text{Doppler: } f_{\pm} = 1 \pm \frac{v_o}{v} f_0$$

Double slit. angles of bright fringes: $\theta_m = m \frac{\lambda}{d}$ where $m = 0, 1, 2, \dots$, d is slit spacing. $I_{\text{double}} = 4I_1 \cos^2 \frac{\pi d}{\lambda L} y$.

Diffraction grating: angles of bright fringes: $d \sin \theta_m = m \lambda$, $m = 0, 1, 2, \dots$

Single slit: angles of dark fringes $\theta_p = p \frac{\lambda}{a}$, $p = 1, 2, 3, \dots$

$$\text{Circular aperture: } w = 2y_1 = 2L \tan \theta_1 \approx \frac{2.44 \lambda L}{D}$$

Electricity and Magnetism

$$\text{Coulomb's } F_{1 \text{ on } 2} = F_{2 \text{ on } 1} = \frac{K |q_1| |q_2|}{r^2}$$

$$\vec{E}(x, y, z) = \frac{\vec{F}_{\text{on } q} \text{ at } (x, y, z)}{q} \quad \text{point charge: } \vec{E} = \frac{1}{4\pi\epsilon_0} \frac{q}{r^2} \hat{r}$$

$$\vec{E}_{\text{dipole}} = \frac{1}{4\pi\epsilon_0} \frac{2\vec{p}}{r^3} \text{ (on axis)} \quad \text{gauss's law } \phi_e = \oint \vec{E} \cdot d\vec{A} = \frac{Q_{in}}{\epsilon_0}$$

$$\text{unif. elec. field: } U_{elec} = U_0 + qEs \quad \text{point charges: } U_{elec} = \frac{K q_1 q_2}{r}$$

$$\text{dipole: } U_{\text{dipole}} = -\vec{p} \cdot \vec{E}$$

New

$$\text{de broglie: } \lambda = \frac{h}{p} = \frac{h}{mv} \quad E_n = n^2 \frac{h^2}{8mL^2}, \quad n = 1, 2, 3, \dots$$

$$\text{snells: } n_1 \sin(\theta_1) = n_2 \sin(\theta_2)$$

Base SI Units length: m, mass: kg, time: s, current: A(ampere), temp: K, amount: mol, luminous intensity: cd(candela)

Symbols

	Name	Units
A	area amplitude	m^2
a	acceleration area	m/s^2
\vec{B}	magnetic field 1	1 tesla = 1 T \equiv 1 N/A m (flux density)
b	damping constant	kg/s
C	capacitance	1 farad = 1 F \equiv 1 C/V
c	speed of light specific heat	299,792,458 m/s J / kg K
d	distance	m
\vec{E}	electric field	1 N/C = 1 V/m
E	energy	1 joule = 1 J = 1 kg m ² /s ²
e	various electron elem. charge various	2.71828... , electron, elem. charge. 1.60 \times 10 ⁻¹⁹ 2.71828... , electron, elem. charge.
F	force	1 N = 1 kg m/s ²
f	frequency various	frequency (1 Hz = 1/s) function, friction (N)
G	gravity constant	6.674 \times 10 ⁻¹¹ N m ² /kg ²
g	accel. d.t. gravity	m/s ²
\vec{H}	magnetic field 2	A/m (field strength)
h	height	m
h	planck's constant	6.626 \times 10 ⁻³⁴ J s
\hbar	reduced planck's	h/2 π
I	intensity electric current mmnt. of inertia	W/m ² 1 ampere = 1 A = 1 C/s kg m ² - "rotational mass"
i	imaginary unit	$\sqrt{-1}$
\hat{i}	x-axis unit vec	also \hat{j} , \hat{k} for y and z axes
J	impulse	kg m/s - equiv to ΔP
K	kinetic energy electrostatic c.	J 8.99 \times 10 ⁹ N m ² /C ²
k_B	boltzmann const. wave number spring constant	1.381 \times 10 ⁻²³ J/K = R/N_A rad/m - "spacial freq. of wave" J/m ²
L	inductance ang. momentum	1 henry = 1 H \equiv 1 Wb/A = 1 T m ² /A kg m ² /s
l	length	m
m	mass	kg
N	various	normal vector, atomic number
N_A	avogadro's num	6.02 \times 10 ²³ 1/mol
n	ind. of refraction quantum number	unitless - $n = c/v$ $n = 1, 2, 3, \dots$, parameterizes quantum energy state for particle
\vec{p}	momentum	kg m/s - $\vec{p} \equiv m\vec{v}$
p	pressure	1 pascal = 1 Pa \equiv 1 N/m ²

\vec{p}	dipole moment	qs , from the negative to the positive charge
Q	heat	1 joule = 1 J = 0.2389 cal
q	elect. charge	1 coulomb = 1 C = 1 A s - (q or Q)
R	elect. resistance gas constant	1 ohm = 1 Ω = 1 V/A 8.314 J/mol K
r	radius	m
S	entropy	
S	entropy	
s	arc length position	m m
T	period abs. temperature	s 1 kelvin = 1 K = $T_C + 273$
t	time	s
U	potential energy	1 joule = 1 J
u	atomic mass unit	1 u = 1.66 \times 10 ⁻²⁷ kg
V	voltage volume	1 volt = 1 V = 1 J/C m ³
\vec{v}	velocity	m/s
W	work	1 N m = 1 kg m ² /s ² = 1 J
w	width	m
x	displacement	m
Z	elec. impedance	1 ohm = 1 Ω
α	ang. accel	rad/s ²
Δ	change in var.	used to signify change i.e. Δx
ϵ	permittivity	F/m = $\epsilon_r \epsilon_0$
ϵ_0	vac. permittivity	8.854 \times 10 ⁻¹² F/m
θ	angle	rad
λ	wavelength	m
μ	mag. moment	A m ²
μ	coeff. friction	unitless
μ	permeability	H/m = N/A ² - $\mu = \mu_0 \mu_r$
μ_0	perm const.	$4\pi \times 10^{-7}$ T m/A
π	π	3.14159...
ρ	mass density resistivity	kg/m ³ - $\rho = m/V$ Ωm - $\rho = 1/\sigma$
σ	conductivity	1/ Ωm
τ	torque time constant	N m - $\tau = \vec{r} \times \vec{F}$ different for circuits, oscillations, etc... 6.28319...
2π		
Φ	field strength	units vary dep. on context
Φ_e	electric flux	$\int_{\text{surface}} \vec{E} \cdot d\vec{A}$
Φ_m	magnetic flux	1 weber = 1 Wb = 1 T m ²
ϕ	phase	radians - operand to sinusoidal fn.
ψ	wave function	unitless, represents q.m. state
Ω	elec. resistance	1 ohm = 1 Ω = 1 V/A
ω	ang. velocity	rad/s
$F \rightarrow N$		$\frac{kg m}{s^2}$

Miscellaneous

$\vec{A} \times \vec{B} \equiv AB \sin \alpha$, in the direction given by right-hand rule
